CPSC 304 Project Cover Page

Milestone #: 4

Date: April 3, 2026

Group Number: 13

Name	Student Number	CS Alias (Userid)	Preferred E-mail Address
Spencer Liu	27641240	f9a3l	spencerliu07@gmail.com
Sean Yan	64322415	q2m3y	dhsyan@student.ubc.ca
William Lin	62611330	u7e0v	williamlin0640@gmail.com

By typing our names and student numbers in the above table, we certify that the work in the attached assignment was performed solely by those whose names and student IDs are included above.

In addition, we indicate that we are fully aware of the rules and consequences of plagiarism, as set forth by the Department of Computer Science and the University of British Columbia

Final project description

This application functions as a stock market tracker and portfolio management system designed to incorporate relationships between various market components. The system uses operations such as asset acquisitions, personal information updates, and removals while providing many views of information on specific tables that may be useful to the average trader, such as joining multiple tables to view trader holdings and utilizing queries to identify specific sectors or companies that exceed global performance averages, as well as seeing which traders are doing well, and what stock they have. Additionally, tables can be organized and downloaded into a CSV.

Changes since Milestone 2

UNIQUE phone number added to entity People in order to satisfy the UNIQUE constraint of query 2. Additionally removed Buys, Sells, Operates, and Reports, as they were not used and clashed with key constraints for other tables.

State of database after running DDL.sql

Located at the bottom of the page.

SQL Queries

1. Insert

In file: appService.js
Line #: 145

```
INSERT INTO Contains (Email, CreatedDate, TickerSymbol, Quantity,
                      PurchasePrice)
VALUES (:email, TO_DATE(:createdDate, 'YYYY-MM-DD'), :tickerSymbol,
       :quantity, :purchasePrice)
```

2. Update

In file: appService.js
Line #: 169

```
UPDATE People
SET Networth = :newNetWorth, Cash = :newCash, Phone = :newPhone
WHERE Email = :email
```

3. Delete

In file: appService.js
Line #: 205

```
DELETE FROM People
WHERE Email = :email
```

4. Selection

In file: src/router/router.js
Line #: 120

```
SELECT *
FROM Assets
WHERE [Column] = :val0 [AND/OR] [Column] = :val1
```

5. Projection

In file: src/controller/feature-projection.js
Line #: 64

```
SELECT [column_names]
FROM [table_name]
```

6. Join

In file: appService.js
Line #: 239

```
SELECT p.Email, p.Name, p.Networth, c.TickerSymbol, c.Quantity,
       a.CurrentPrice,
       a.Name AS AssetName, (c.Quantity * a.CurrentPrice) AS
       MarketValue, (c.Quantity * (a.CurrentPrice - a.PurchasePrice))
       AS ProfitAndLoss
FROM People p
JOIN Contains c ON c.Email = p.Email
JOIN Assets a ON a.TickerSymbol = c.TickerSymbol
WHERE p.Email = :email
```

7. Aggregation with GROUP BY

In file: src/controller/feature-seven.js
Line #: 5

```
SELECT Exchange, count(*) ,avg(CurrentPrice), avg(CurrentPrice -
       LastPrice)
FROM Assets
GROUP BY Exchange
```

This query groups assets by their respective stock exchanges to calculate the total number of listings, the average current price, and the average price movement for each market.

8. Aggregation with HAVING

In file: appService.js
Line #: 301

```
SELECT Sector, AVG(EarningsPerShare) as AvgEPS
FROM Stocks
GROUP BY Sector
HAVING AVG(EarningsPerShare) > :threshold
```

This query finds sectors that have an EPS above some user defined threshold.

9. Nested Aggregation with GROUP BY

In file: src/controller/feature-nine.js
Line #: 19

```
SELECT Sector, avg(EarningsPerShare)
FROM Stocks
GROUP BY Sector
HAVING avg(EarningsPerShare) >
     (SELECT avg(EarningsPerShare)
     FROM Stocks)
```

This query finds high performing industry sectors by comparing each sector's average earnings per share against the global average for all stocks in the database.

10. Division

In file: src/controller/feature-ten.js
Line #: 5

```
SELECT p.Email
FROM People p
WHERE NOT EXISTS (SELECT c.CompanyID
                  FROM Companies c
                  WHERE c.IsPublic = 1
                  AND NOT EXIST    (SELECT o.Email
                                    FROM Owns o
                                    WHERE o.Email = p.Email
                                    AND o.CompanyID = c.CompanyID))
```

This query finds individuals who maintain an ownership stake in every company designated as public in the database.

Informal Citations

Assuming the milestone guide did not require a formal citation:

https://www.w3schools.com/ - General refresher for HTML, CSS, and JS used for the project. We already had rough previous knowledge on these from courses taken before.

Sample node_project provided at the start of milestone 4 was referenced for certain CSS styles and javascript functions, and often built off of for other functions.

The same provided node_project sample was also used for the logic of the controller, router, and many querying functions.

AI Declaration

AI was used for exporting our DDL.sql into Google Sheets, as well as debugging the project after the main project was done.
